Is your perfusion circuit the best that it can be?

With continued decreasing reimbursements, reducing the costs associated with your perfusion circuit can have significant positive impact on the overall cost of your cardiac surgery service.

Perfusion circuits are inherently deleterious. Hemodilutional and inflammatory influences translate into prolonged ventilator times, longer ICU and hospital length of stay, as well as, increases transfusion requirements.

Perfusion International has developed a minimum prime circuit that allows for all of the functionality of your current system while decreasing the circuits prime dramatically. A shorter circuit, combined with full tubing tip to tubing tip biocompatibility will have very positive results for your patients and improve your outcomes and decrease your total costs.

Contact us to set up an appointment to evaluate your current perfusion system.
